

# Internet of insular solutions?

Reuse your solutions completely new.

**All data, all systems –  
intelligently consolidated.**  
IoT with classix.

## The insular solution

Everyone knows it – the insular solution. In the middle of the archipelago of business software solutions.

There are insular solutions in nearly every company, often established over decades. And constantly new ones are added. They flawlessly accomplish their intended tasks - and only these tasks. Any modification or extension might strand on another (possibly even-new) island.

You have them, you need them, but insular solutions interfere with the continuous digitization of processes. And obstruct a holistic view onto the company: they are just islands.

## The technical connection approach

Connecting islands is complicated, because every insular solution is unique in itself: Its coastal line, its inner workings, its structures and rules – its evolution. Every island is different from all other islands.

Interfaces mean effort, compromises and maintenance costs. Data must either be held redundantly or are not available. The digital mapping of the business processes cannot be achieved without gaps.

Pure technical connection systems are not able to support the continuous digitization of companies in a holistic way. As technical connection protocols alone do not represent the superordinate structure of a company, the complexity of companies cannot be tackled sufficiently.

## Our consolidated business solution

The solution is a central system based on the ClassiX architecture. From all existing insular solutions of a company, data will be collected, organized and standardized according to strictly economic criteria only. This data will be consolidated independently of their respective functionality in its insular solution.

With this flexible ClassiX solution you will be able

- ▶ to get all information of all your systems at any time, from any place and with any device
- ▶ to enrich information, make new connections and evaluate it graphically
- ▶ to detect possible faults and take countermeasures at an early stage
- ▶ to recognize optimization potential by means of simulation
- ▶ to take decisions faster and well-founded

When new tasks arise, you have the choice between integrating another highly specialized insular solution or mapping new functionality inside the central ClassiX system, completely integrated with your existing application.

## See for yourself

Contact us. Put us to the test. We would be glad to explain to you in a personal meeting, why the ClassiX architecture **guarantees a holistic view of your company** and how it can be introduced in an agile way.

ClassiX gives you a real alternative.  
**This is IOT.**
